4. Technical Requirements Specification

Test Requirement:	EN 50663		
Limit:	Exposure tier	Region of body	P _{max} (mW)
	General public	Head and trunk	20
		Limbs	40
Test Setup:	 <pre> graph TD PS[Power Supply] --> EUT[EUT] EUT --> CB[Combiner Box] CB --> PSB[Power Sensor Box] PSB --> PC[PC] PC --> VSG1[VSG] PC --> VSG2[VSG] PC --> S[Spectrum] PC --> K[Keyboard] VSG1 --> PS </pre>		
Test Procedure	<p>Step 1: Use a fast power sensor suitable for 2,4 GHz and capable of 1 MS/s. Use the following settings:</p> <ul style="list-style-type: none"> - Sample speed 1 MS/s or faster. - The samples must represent the power of the signal. - Measurement duration: For non-adaptive equipment: equal to the observation period defined in clauses 4.3.1.2.1 or 4.3.2.3.1. For adaptive equipment, the measurement duration shall be long enough to ensure a minimum number of bursts (at least 10) are captured. <p>Note 1: For adaptive equipment, to increase the measurement accuracy, a higher number of bursts may be used.</p> <p>Step 2: For conducted measurements on devices with one transmit chain: -Connect the power sensor to the transmit port, sample the transmit signal and store the raw data. Use these stored samples in all following steps. For conducted measurements on devices with multiple transmit chains: -Connect one power sensor to each transmit port for a synchronous measurement on all transmits ports. -Trigger the power sensors so that they start sampling at the same time. Make sure the time difference between the samples of all sensors is less than half the time between two samples. -For each instant in time, sum the power of the individual samples of all ports and store them. Use these stored samples in all following steps.</p> <p>Step 3:</p>		

	<p>Find the start and stop times of each burst in the stored measurement samples.</p> <p>Note 2: The start and stop times are defined as the points where the power is at least 20 dB below the RMS burst power calculated in step 4.</p> <p>Step 4:</p> <p>Between the start and stop times of each individual burst calculate the RMS power over the burst. Save these Pburst values, as well as the start and stop times for each burst.</p> <p>Step 5:</p> <p>The highest of all Pburst values (value "A" in dBm) will be used for maximum e.i.r.p. calculations.</p> <p>Step 6:</p> <p>Add the (stated) antenna assembly gain "G" in dBi of the individual antenna.</p> <p>If applicable, add the additional beamforming gain "Y" in dB.</p> <p>If more than one antenna assembly is intended for this power setting, the maximum overall antenna gain (G or G + Y) shall be used.</p> <p>The RF Output Power (P) shall be calculated using the formula below:</p> $P = A + G + Y$
