<b>Test Setup:</b>	<p>Remark: E.U.T: Equipment Under Test LISN: Line Impedance Stabilization Network Test table height=0.8m</p>		
<b>Test Procedure</b>	<p>The E.U.T and simulators are connected to the main power through a line impedance stabilization network (L.I.S.N.). The provide a 50ohm/50uH coupling impedance for the measuring equipment. The peripheral devices are also connected to the main power through a LISN that provides a 50ohm/50uH coupling impedance with 50ohm termination. (Please refer to the block diagram of the test setup and photographs). Both sides of A.C. line are checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to EN55032 Class B on conducted measurement.</p>

**Test Procedure:**

**From 30MHz to 1GHz:**

1. The radiated emissions test was conducted in a semi-anechoic chamber.
2. The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane, but separated from metallic contact with the ground reference plane by 0.1m of insulation.
3. Before final measurements of radiated emissions, a pre-scan was performed in the spectrum mode with the peak detector to find out the maximum emissions spectrum plots of the EUT.
4. The frequencies of maximum emission were determined in the final radiated emissions measurement. At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the maximum disturbance. Measurements were performed for both horizontal and vertical antenna polarization.

**Above 1GHz:**

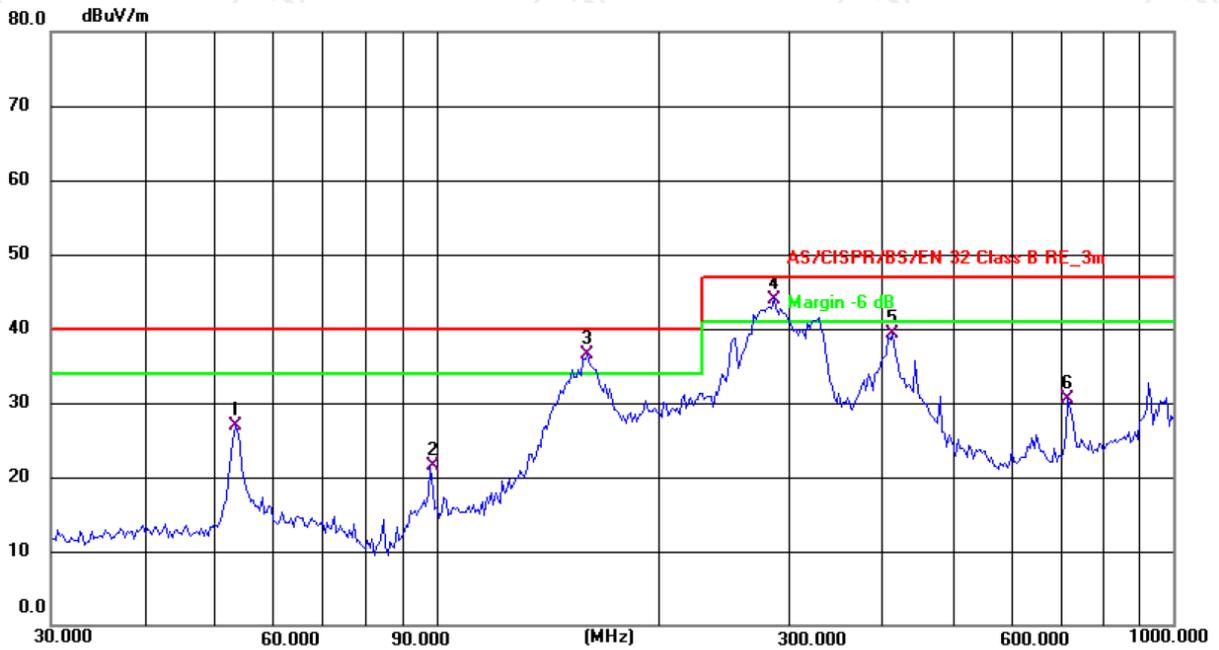

1. The radiated emissions test was conducted in a fully-anechoic chamber.
2. The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane, but separated from metallic contact with the ground reference plane by 0.1m of insulation.

<b>Test Level:</b>	1.0kV on AC port
<b>Polarity:</b>	Positive & Negative
<b>Repetition Frequency:</b>	5kHz
<b>Burst Duration:</b>	15ms
<b>Burst Period:</b>	300ms
<b>Test Duration:</b>	2 minute per level & polarity
<b>Test setup:</b>	 <p>The diagram illustrates the test setup. An EMC Tester and the Under Test Equipment (EUT) are placed on a non-conducted table. The table is supported by a wood support that is 80cm high. The table is placed on a ground reference plane, with a 10cm gap between the table and the ground plane. A grounding cable is connected to the table. The ground reference plane is a 1m*1m metallic sheet with a minimum thickness of 0.65mm.</p>
<b>Test Procedure:</b>	<p>The EUT and its simulators were placed on the ground reference plane and were insulated from it by a wood support 0.1m + 0.01m thick. The ground reference plane was 1m*1m metallic sheet with 0.65mm minimum thickness. This reference ground plane was project beyond the EUT by at least 0.1m on all sides and the minimum distance between EUT and all other conductive structure, except the ground plane was more than 0.5m. All cables to the EUT was placed on the wood support, cables not subject to EFT/B was routed as far as possible from the cable under test to minimize the coupling between the cables.</p> <p>Test on Signal Ports, Telecommunication Ports and Control Ports: The EFT interference signal is through a coupling clamp device couples to the signal and control lines of the EUT with burst noise for 2 minutes. Test on power supply ports: The EUT is connected to the power mains through a coupling device that directly couples the EFT/B interference signal. Each of the Line and Neutral conductors is impressed with burst noise for 2 minutes. The length of the signal and power lines between the coupling device and the EUT is 0.5m</p>

A Fixed Pad is connected to a CDN (coupling and decoupling device), which is connected to the EUT (Equipment Under Test). The EUT is supported by an Insulating Support that is 10cm high above a Ground Reference Plane. Another Ground Reference Plane is shown below the table.</p>
<b>Test Procedure:</b>	<ol style="list-style-type: none"> <li>1. Let the EUT work in test mode and test it.</li> <li>2. The EUT are placed on an insulating support 0.1m high above a ground reference plane. CDN (coupling and decoupling device) is placed on the ground plane about 0.3m from EUT. Cables between CDN and EUT are as short as possible, and their height above the ground reference plane shall be between 30 and 50 mm (where possible).</li> <li>3. The disturbance signal described below is injected to EUT through CDN.</li> <li>4. The EUT operates within its operational mode(s) under intended climatic conditions after power on.</li> <li>5. The frequency range is swept from 0.150MHz to 80MHz using 3V signal level, and with the disturbance signal 80% amplitude modulated with a 1 Hz sine wave.</li> <li>6. The rate of sweep shall not exceed <math>1.5 \times 10^{-3}</math> decades/s. Where the frequency is swept incrementally; the step size shall not exceed 1% of the start and thereafter 1% of the preceding frequency value.</li> </ol> <p>Recording the EUT operating situation during compliance testing and decide the EUT immunity criterion.</p>
